# IAAF INTERNATIONAL MEASUREMENT SEMINAR 

*     *         * San Juan, Puerto Rico * * *

February 4 \& 5, 2006

## Organization of the Seminar

In 2005 I was contacted by Amadeo Francis, IAAF Vice President. He asked whether I was free to conduct a measurement seminar in February. I responded with an enthusiastic "yes." Amadeo put me in touch with Linda Velez, PLS, PE, President, Instituto de Agrimensores del Colegio de Ingenieros y Agrimensores de Puerto Rico (CIAPR), who was responsible for the general organization of the seminar. Linda contacted surveyors from all parts of Puerto Rico, and 17 came to the seminar.

## The Venue

The seminar was held at the Parque Julia de Burgos in Carolina, a suburb of San Juan. The park contains about 1.7 km of bike paths, with a large picnic house conveniently located for use as a classroom. The test course was approximately 740 meters in length, with a 270 meter straight portion available nearby for the layout of a calibration course.

## Preliminary Preparation

Before the seminar a general outline of the work and a statement of requirements was sent to Linda. When I arrived everything was ready. Each student had use of a bicycle and a Jones counter. I came to the venue the afternoon before the seminar to make decisions regarding how it could best be used.

## Conduct of the Seminar

Day 1 - Saturday, February 4 - Everybody came to the picnic house, arriving from 8 to 9 AM. Jones counters were mounted to the bicycles. Breakfast was provided by CIAPR. I was introduced, made some preliminary remarks, and explained that we would first lay out a calibration course. Since all of the
 students were professional surveyors I did not feel it necessary to explain the use of the steel tape.

Nailing the end points of the calibration course

We left the classroom and went south on the bike path. I asked the students to lay out two parallel calibration courses on the path. I wanted to have parallel calibration courses so that we would have one-way traffic on each calibration course. I explained that in normal measurement a single calibration course was generally used. Only 270 meters was laid out because that was all that was available in a straight line. I explained that this length was suited to the venue and for instruction, but that 300 meters was the minimum acceptable for real-world measurements.

Once the calibration courses had been marked with a PK survey nail at each end, we returned to the classroom.

I explained that I would demonstrate the procedure of precalibration, measurement, and postcalibration, and then I would ask them to do the same thing. With students observing, I measured the distance between two points, $A$ and $B$, on the bike path north of the classroom, and continued on from $B$ to lay out a 1 km point. I explained to the students that each one should establish their own position of 1 km , and that later we would take a photograph of everybody standing on their mark. This gives people a good idea of how measurements can vary.

Taping the calibration course

Calibrating the bicycles

Measurers at their $\mathbf{1 k m}$ Marks

When I was finished with my measurement, the students assembled at the calibration course and began their measurement work. I went to the classroom and did my calculations. I posted my calculations and results on an easel so all could read them and see what I did.

Students took several hours measuring and calculating. Lunch was brought to the classroom at mid-day, and everybody enjoyed the meal.

As each measurer completed his work, he was asked to write his result on the easel. I had the shortest measurement, as I expected, and I explained how adherence to the Shortest Possible Route (SPR) was the way to get similar results. I collected all the data sheets for use in preparing this report.

During this time I was approached by Luis J. Barrios Montes. He explained that he could not balance on a bicycle, so he had one of the other students ride the bike while he did the calculations. He wondered whether this was acceptable. I explained that the bicycle riding was part of the measurement process. He asked whether it was all right for him to bring a tricycle the next day to use as a measurement bicycle. I said OK, bring it. I thought it was not as good as a bicycle, but with care it should enable him to get his own data.

Day 2 - Sunday, February 5 - We again met at the classroom. Breakfast was served. Luis had brought a brand-new tricycle, and it was admired by all the students. I explained that today would be easier, as now we all had experience. I said that today we would make multiple rides of distance A-B, and that each measurer could make as many rides as he wished, and use the best one as official. I explained that the
measurements would improve as the course became more familiar. I walked my bike along part of the course to demonstrate the SPR, explaining about 30 cm clearance from edges, and tangents between bends in the path.

Luis J. Berrios Montes with his tricycle

The mood this day was much less nervous than on Saturday. The measurers were more sure of themselves, and the measurement results showed a great improvement. The spirit of competitiveness was present, and people appeared to be taking pleasure in the exercise.

Luis' tricycle was also used by Linda Velez, who took time away from supervising the seminar to actually measure the route.

With measuring done, we went to the classroom and calculated results. Each measurer again posted results on the easel, and compared them with yesterday's results. All but two showed significant improvement of the first day's measurement, indicating that they had a better understanding of how to follow the Shortest Possible Route.

After lunch we enjoyed free-flowing discussions of various measurement topics, followed by a closing ceremony and presentation of certificates attesting that the participants had earned IAAF "C" level measurement status.

## Discussion of Results

Results of the measurements are presented in this report. Included are:

1) List of measurers
2) Measurement results from day 1
3) Measurement results from day 2

On return home, I used the data provided by each measurer to correctly calculate the course length, using a computer. Sometimes the computer value does not agree with the length calculated by the measurer. In these cases, either the student or I made a mistake. Some common mistakes were:

- Loose riding - failure to follow the Shortest Possible Route
- Transposing numbers or incorrectly reporting
- Rounding off calibration figures prematurely
- Incorrect calculation of calibration figures
- Incorrect calculation of distances
- Incomplete data submitted to me at the seminar

Each student should study his numbers, and compare them with the computer calculations. Where there is a difference, checking will discover the reason.

What was the length of the course? - No one can say with certainty, but my estimate is about 737 meters. There is no clearly-defined way to calculate course length when many measurements exist. One method is to throw away the obvious outliers and use the median measurement of the rest. This is generally reliable. Other methods have been proposed, but ultimately some judgment must be used.

Most of the measurers had numbers in reasonable agreement with the above. The rest will improve with more practice. In only one day we saw an enormous improvement - more riding practice will certainly improve each measurer's riding.

The test course was almost entirely curved, with one 180 degree turn. As a result, measurements had more variation than would be the case if there had been more straight parts. The students did well to get their results.

All students have now learned the most important part of course measurement - the riding of a tight, correct line, following the Shortest Possible Route. All the calculation in the world cannot correct the results of a bad ride. The students are ready for more measurement work. And all are now officially proclaimed as IAAF Measures, grade "C."

## Upgrading from "C" to "B"

Students are encouraged to submit measurements for certification. Material should be submitted to Pedro Zapata, USATF Road Course Certifier, Puerto Rico (pzapata@ptmpr.com). If all is correct, he will issue a USA Track \& Field Certificate of Accuracy for the course. After a student has successfully applied for and been granted 4 or 5 USATF certificates, I will recommend them for upgrading to " B " level.

## A Personal Note

I had a wonderful time conducting this seminar. All of the students were enthusiastic and eager to learn, and many perceptive questions were asked. This is a good sign - an inquiring mind will learn quickly. The improvement between day 1 and day 2 was impressive. I was very happy to see it. I am confident that as the measures work they will improve. In several cases, little improvement is possible, as results showed they are already well along.

All students are invited to correspond with me in Spanish. Although I cannot speak it well, I can understand the written word. I will answer all questions in English and Spanish.

My thanks to Linda Velez, without whose work this seminar would not have happened. I would have hated to miss it.
